* consists of 4 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will

It currently consists of 8 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the configs are represented as runs of N. but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence.

It currently consists of 54 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs N, but the exact sizes of the gaps

COMMENT

is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved. contig of 1049 bp in length gap of unknown length contig of 1150 bp in length gap of unknown length gap of unknown length gap of unknown length contig of 1016 bp in length gap of unknown length gap of unknown length length bp in length contig of 2022 bp in length gap of unknown length contig of 1525 bp in length bp in length length length bp in length lèngth bp in length ength. length length length ength ength length ength length Length ength ength length length length contig of 1064 by gap of unknown lay gap of unknown 21907: 26520: 28020: 42335: 42435: 46627: 48152: 22299: 23399: 4013: 5129: 5229: 62293: 6393: 7511: 8743: 11379: 12440: 12540: 23307: 24909: 33610: 36368: 19859: 44405: 1076: 2290: 2390: 11056: 11156: 5136: 9333: 5009: 6420: 8120: 34987: 35087: 8843: 20807 .0107 11279 3207 6497 7807 0007 13893 13991

arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               457 The present invention describes detecting nucleotide triplet repeats in a region of human chromosome 18q disposed between polymorphic markers D18868 and D183979 to identify a human gene associated with a mood disorder or related disorder. AAX8854 to AAX88705 represents human chromosome 18q TAC clones and primers corresponding to them, used in the exemplification of the present invention. TAC clones comprising a portion of the region of human chromosome 18q between markers D18588 and postion of the region of human chromosome 18q between markers D18588 and clisorder, is chosen from the Diagnostic and Statistical Manual of Mental Clisorder, is chosen from the Diagnostic and Statistical Manual of Mental Clisorders, version 4 (DSM-IV) taxonomy. This includes mood disorders (296.XX, 300.4, 311, 301, 13, 295.70), schizophrenia and related clisorders (296.XX) and personality disorders (209.SI, 308.3), adjustment disorders (309.XX) and personality disorders (209.SI, 308.3), adjustment disorders (309.XX) and personality disorders (200.SI). Thobes derived from quenes associated with the mood clisorder or related disorder can be used to detect pathological antibodies can be used to determine the susceptibility of an individual condition or genetic variations in patients. The methods, probes and antibodies can be used to determine the susceptibility of an individual conditions or genetic variations disorder. The nucleic acids and proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer, disease, AlDS, epilepsy, neurofibromatosis, rhemmatoid arthritis, psoriasis and inflammatory/uloerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4670 AATAAATAAAATGAAATAAGATTTGGGATGTATTTTTTTGGTTAAGTAATTAGAAAAGA 4729

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             EST; expressed sequence tag; secreted protein; cDNA isolation;

It was isolated from a human placenta lambda still cDNA library by screening with a probe generated by PCR amplification of placenta cDNA using primers (see also AAT35222-23) based on the CAP-1 protein. A cDNA clone (AAT35221) for CAP-3 (AAR99254) was also isolated. These cDNA clones can be incorporated into expression vectors and used for prodn. of recombinant CAPs in transformed or transfected host (pref. mammalian) cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Caspase; serpin; inflammation; apoptosis; lung disease; human; CAP; neurodegenerative disease; heart; liver tissue; Alzheimer's disease; Parkinson's disease; amyotrophic lateral sclerosis; injury; trauma; hypoxy ischaemia; cytoplasmic antiproteinase-2 protein; CAP-2; nootropic; neuroprotective; vasotropic; tranquilizer; vulnery; ss.
                                                                                                                                                                                                                                                                                                                 Human cytoplasmic antiproteinase-2 (CAP-2) and CAP-3 - serine protease inhibitors useful in the purification of proteins and in the treatment of inflammatory diseases and apoptosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human cytoplasmic antiproteinase-2 protein (CAP-2) encoding cDNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from cligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating oDNA sequences cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  296 ATCTGCCGGAAGCCTTGCCCTCAATCAAGGCGGACGTGAAGCATCTACAAAGGAGGAATA 355

The invention relates to detecting (MI) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (GS) identified by DNA chip analysis as given in the specification, and comparing the expression level in an unactivated the expression level in an unactivated of CG. where differential expression of Gs is indicative of GGA.

Also included are modulating (M2) GA by contacting of with an agent that alters the expression of at least one gene in GS; (2) screening (M3) chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the chronic) in a tissue, an allergic response in a subject, or a pathogen or sterile inflammatory disease, by detecting the chronic or exposure of a subject to a pathogen or sterile inflammation (especially chronic) or in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammation with an agent that modulates the expression of gene(s) from GS in the tissue. M1 is useful for screening and tissue, modulating GA, M3 is useful for screening and etscribly in an inflammation in a tissue, M4 is useful for screening of GA preferably in an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory down disease (e.g. psoriasis, rheumator) deathoritis, glomentory disease, crohi sissue, ulcerative oilitis, perfection, perfection, protozoal infection, viral infection and M5 is perfecting or treating one detecting one date down of the above conditions. Pur present sequence represents a gene differentially expressed in granulocytes.
                                                          Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                335 AGCATCTACAAAGGAGGAATAGTCAAAGCAGCAGCGGCGGCGGCGGCGGCGCCAGCAGCA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ó
                                                                                                                                                                                                                           The invention provides a method for treating a disease mediated by a caspase in an individual. The method comprises: administering a composition comprising a gene coding for an intracellular mammalian serpin in an amount sufficient to inhibit activity of the caspase upon transient expression of the gene in a target tissue affected by the disease, where the disease or the symptoms are treated. The method can be used for decreasing inflammation, for modulating apoptosis, for treating a lung disease, and for treating a neurodegenerative disease. The inflammation and apoptosis that can be treated are particularly in heart or liver tissue. It can be used for treating Alzheimer's disease, parkinson's disease, amyotrophic lateral sclerosis, and acute injury
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  such as hypoxy-ischaemia or trauma. The present sequence represents a cDNA encoding the human cytoplasmic antiproteinase-2 protein (CAP-2), an intracellular serpin protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Method for treating disease or symptoms of a disease mediated by a

                                                                                                                                                                                                                                      This sequence represents a gene encoding a subunit of the cellulose synthase complex of Vigna angularis. The invention relates to subunits cellulose synthetic equipment, that can be used to increase the amount cellulose synthesised by a plant. The proteins and genes encoding them can also be used to improve the properties of the cellulose being produced by a plant.

This DNA encodes a stabilising polypeptide and is the FLGA insert of the invention. The invention provides a method for increasing the resistance of a core protein to proteintyle degradation that comprises linking or inserting onto or into the core protein a stabilising polypeptide of commia [(Glya)X(Glyb)X(Glyc)Z]n where Glya, Glyc are 1-6 sequential Gly residues and X, Y, Z are Ala, Ser, Val, Ile, Leu, Met, phe, Pro or Thr and n can be anything between 1-66 X, Y and Z need not be identical from n repeat to n repeat. Alternatively a nucleic acid encoding the stabilising polypeptide can be linked onto or inserted into a nucleic acid encoding a core protein. The fusion proteins of the invention are more resistant to degradation by proteases and, thus, have a longer half-life than the unfused core protein. The products can be used for treating autolimmune diseases, cancer and inflammation. In particular, the core protein may be an IkappaB regulator protein for the treatment of inflammatory bowel disease, or a nitroreductase protein record protein example producty therapy to treat cancer or or other pathological conditions. The fusion proteins can also be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

EBNA 1 protein is used to stably maintain episomes containing EBV origin of replication (oriP) and a gene encoding protein or RNA of interest. Eucaryotic host cells expressing EBNA 1 protein are transfected with these episomes to produce recombinant cell lines expressing multiple genes of interest. This provides a

rapid and reliable method of stably expressing multiple genes in transfected cells. The episones are useful in the transfection of genes encoding receptors, transporter proteins, ion channels, adhesion molecules and transcription factors. The episones carrying desired genes can also be used to transfect cells in gene therapy, antisense therapy,

polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating a footoders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity amino acid sequence at Asset197-Ass95564 represent novel human diagnostic coding sequences of the invention.

Constitution, but was obtained in electronic format directly from WIPO specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

polynucleotide (PN) (1) comprising a contiguous span of 8 to 50 nucleotides, where the span includes a G713 or chromosome 13431-433 related hallelic marker. (1) has neucleotide cattvity and can be used as a G713 gene expression inhibitor. (1) can be used genotyping to estimate the frequency of an allele of a G713 or chromosome 13431-433 related biallelic marker in a population, and of a haplotype for a set of biallelic markers in a population. (1) is also useful in detecting an association between a haplotype and a trait. The frequency is used for detecting an association between a genotype and a trait. being schizophrenia. The genotype is used to determine whether an individual is at risk of developing schizophrenia. (1) can also be used as a medicament against several disorders preferably brait, psychiatric clisorders such as schizophrenia and bipolar disorder. Early identification of risk of developing schizophrenia and bipolar disorder. Early identification of risk of developing schizophrenia (1) can also be used as a medicament as a schizophrenia and bipolar disorder. Early identification of risk of developing schizophrenia (1) and a possible, which copresent human G713 genomic DNA sequences; AAA55967 encodes the numan G713 protein AAY90963; AAA55968 encodes the murine G713 protein and AAA5964 condessent condessent DNA baa55964 condessed the mana chromosome 13431-433 locus AAA55032 represent PCR primers used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                406 AGGIGGGGCCICIGCCAGGIACCGGGCGGGGGAGGCACGAGGIGCCCAGGIICCCGCG 465

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ద
                                                                                                                                                                                                                                                                                 The present invention describes an isolated, purified or recombinant polynucleotide (PN) (I) comprising a contiguous span of 8 to 50 nucleotides, where the span includes a G713 or chromosome 13431-q33 crelated biallelic marker. (I) has neuroleptic activity and can be used as a G713 gene expression inhibitor. (I) can be used genotyping to estimate the frequency of an allele of a G713 or chromosome 13431-q33 crelated biallelic marker in a population. (I) is also useful in detecting an association between a haplotype and a trait. The frequency is used for detecting an association between a genotype and a trait being confizohrenia. The genotype is used to detecting an association between a genotype and a trait being schizophrenia. The genotype is used to determine whether an individual is at risk of developing schizophrenia. (I) can also be used as a medicament against several disorders preferably brain, psychiatric disorders such as schizophrenia and bipolar disorder. Early indentification of risk of developing schizophrenia is possible, which confidentification of risk of developing schizophrenia is possible, which confidentification of risk of developing schizophrenia is possible, which confidentification of risk of developing schizophrenia is possible, which corpresent human G713 genomic DNA sequences; AAA55967 encodes the human G713 protein AAY9062; AAA55968 encodes the murine G713 protein AAY9062; AAA55969 encodes the murine G713 protein AAY9063; AAA55969 encodes the muran corpus and AAA56031 and AAA56032 represent PCR primers used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           406 AGGIGGGGCCICTGCCAGGTACCGGGCGGGGCAGGCACGGAGGTGCCCAGGTTCCCGCG 465

Novel human genes and their expression products which are

Aifferentially expressed in different cell types

XX

Claim 1; Page 2147; 2479pp; English.

XX

Comprising the sequences given in AAZ12532 to AAZ1779. Also described is

CC amethod of detecting differentially expressed genes correlated with the

cancerous state of a mammalian cell, comprising detecting at least one

differentially expressed gene product in a test sample from a cell

CC suspected of being cancerous, where the gene product is a correlated by one

cuspected of being cancerous, where the gene product is encoded by one

of the 5248 polynucleotide sequences given in AAZ12532 to AAZ17779. The

colynucleotides can be used as a source of primers and probes, which can

cc be used for a variety of purpose, e.g. detection of expression levels,

mapping, tissue typing or profiling, forensics, genetic analysis and

detection of polymorphisms. Polypeptides encoded by the polymucleotides

cc an be used for rasing antibodies for experimental, diagnostic and

therapeutic purposes. The polymucleotides may also be used to construct

crans be used for rasing antibodies for experimental, diagnostic and

therapeutic purposes. The polymucleotides may also be used to construct

crans be used for a variety abnormal or diseased tissue in a human, to

identify a genetic predisposition or susceptibility to a disease such as

cc ancero. The polymucleotides can also be used to screen for

cc diagnosis, proquosis and management of colorectal cancer, breast cancer,

and lung cancer. The polymucleotides can also be used to screen for

cc peptide analogues and antagonists.
